Client-Side Scripting: CA2 Contact App

Due Date: April 27th

Using JavaScript and HTML5, develop a small contact app. The app should record a user title, username, telephone number, email, password and a short description of the user. When the app is first loaded, five contacts are added automatically from an array.

The App has the following features:

Add: adds an additional contact to your list
Delete: removes a contact from your list
Find: returns found contact details or display the appropriate error message
List: list all your current contacts
Edit: edit contact details

The GUI should consider accessibility issues. However, the content and layout are left to the students discretion.

Marking scheme

Addition of contact	10%
Deletion of contact	10%
Listing of contacts	10%
Edit contacts	10%
Find contact	10%
GUI	50%
